SCLS377G - AUGUST 1997 - REVISED JANUARY 2002

## Operating Range 2-V to 5.5-V V<sub>CC</sub>

### description

The SN74AHC1G125 is a single bus buffer gate/line driver with 3-state output. The output is disabled when the output-enable  $(\overline{OE})$  input is high. When  $\overline{OE}$  is low, true data is passed from the A input to the Y output.

# DBV OR DCK PACKAGE (TOP VIEW) OE 1 5 VCC A 2 GND 3 4 Y

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

NOTES: A. C<sub>1</sub> includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR  $\leq$  1 MHz,  $Z_O = 50 \Omega$ ,  $t_f \leq 3$  ns,  $t_f \leq 3$  ns.
- D. The outputs are measured one at a time with one input transition per measurement.
